What is Xanax?

Xanax (generic name Alprazolam) is a benzodiazepine that acts as a central nervous system depressant to calm the brain and nerves. It is primarily used to treat generalized anxiety disorder (GAD) and panic disorder. This medication works by enhancing the activity of GABA, a neurotransmitter that inhibits brain activity and promotes relaxation.

Xanax is available in both immediate-release and extended-release (XR) forms. While immediate-release Xanax provides rapid relief from acute anxiety, the extended-release (XR) version gradually releases the medication over 24 hours, offering consistent anxiety control throughout the day.
