### What is Tramadol?

Tramadol is an opioid analgesic that works on the central nervous system by binding to mu-opioid receptors and inhibiting the reuptake of norepinephrine and serotonin. This dual mechanism reduces the perception of pain and improves overall pain tolerance. As a Schedule IV controlled substance, Tramadol should only be used as prescribed. Those looking to **order Tramadol online** should always ensure they use **licensed and verified online pharmacies** to avoid counterfeit or unsafe products.
